## Interpreting Data on Cotton Varieties

State	2009 No. of locations	2009 No. of entries	Means per parameter (w/o across loc means)
Missouri	3	Main = 36 or 44	124
Tennessee	6	Main = 45	270
Arkansas	4	Main = 31	124
	4	New = 19	76
Mississippi – Delta	5	Main = 31	155
	2	New = 18	36
Mississippi - Hill	4	Main = 31	124
	2	New = 18	36
Louisiana	6	Early = 21 or 25	142
	6	Mid = 16 or 20	112
<b>Total</b>	<b>32 diff. loc.</b>		<b>1199</b>

## Interpreting Data on Cotton Varieties

### Number of Parameters: Arkansas Cotton Variety Test

Loc	Rep	Parameter	Observations per entry	Means per entry
4	4	4 (LY, HT, OB, SPA)	64	16 +1
4	2	5 (L%, SI, LI, FPS, Fden)	40	20 +1
4	2	6 (QS, Mic, Len, UI, Str, Elo)	48	24 + 1
1	4	3 (Lpub, Spub, Btri)	12	3
1	12	1 (TPB)	12	1
	<b>Total</b>	<b>19</b>	<b>176</b>	<b>67</b>

# Numbers! Numbers! Numbers!

## Interpreting Data on Cotton Varieties

3 zones (Eastern, Central, Western)

~ 30 locations per zone

~ 40 entries per location

= ~3,600 means for each parameter

6 parameters \* 3,600 = 21,600 means!

Plus: Means across locations

Additional parameters

Usually 4 replications

# Yield and Yield Component Parameters

## Arkansas Cotton Variety Test, 2003-2009

Parameter	No. of tests	Sign. (0.10) Variety effect	Sign. (0.10) Loc. effect	Sign. (0.10) Var. x Loc.
Lint yield	16	100%	100%	100%
Seed per acre	16	100%	100%	100%
Lint %	16	100%	100%	63%
Seed index	16	100%	94%	56%
Lint index	16	100%	94%	50%
Fibers per seed	16	100%	94%	56%
Fiber density	6	100%	83%	50%

# Maturity and Fiber Parameters

## Arkansas Cotton Variety Test, 2003-2009

Parameter	No. of tests	Sign. (0.10) Variety effect	Sign. (0.10) Loc. effect	Sign. (0.10) Var. x Loc.
Open bolls %	16	100%	94%	82%
Plant height	16	100%	100%	44%
Q-score	6	100%	33%	50%
Micronaire	16	100%	94%	56%
Length	16	100%	94%	38%
Unif. Index	16	100%	81%	6%
Strength	16	100%	81%	19%
Elongation	16	100%	81%	38%

# Variety x Location Interactions

1. Soil type
  - ✓ Texture
    - Surface/internal drainage; fertility
2. Diseases
  - ✓ Verticillium wilt
  - ✓ Root-knot nematode
    - Reniform nematodes and other diseases
3. Insects
  - Different technologies (various Bt's & non-Bt)
  - Insect infestations
  - Varietal responses to insect pests
4. Maturity
  - ✓ Latitude of test site
    - Variety differences in fruiting
    - Stand/emergence consistency (different seed sources)
5. Management of test
  - ✓ Irrigated or non-irrigated
    - Timing of planting, irrigation, other inputs, defoliation
    - Control of maturity (plant growth regulators)

# Evaluation of Lint Yields

## Specific location adaptation:

Examine test sites with similar soil texture, disease incidence, latitude, and irrigation status.

- Use multiple years (often limited).
- May have few “similar” sites.

## General (or wide) adaptation:

Examine as many sites and years within broad area that are available.

- Year-to-year variation  $\geq$  site-to-site variation.
- May include non-similar sites and years, but “cream-to-the-top”.

# Older Varieties Data Set - 3 years, 2007-09

(2 & 3 year data usually reported, these evaluated > 2 years, rank out of 20)

Variety	Lint yield, lb/a	Keiser	Judd Hill	Marianna	Rohwer
DP 174 RF	1175	4	9	2	1
PHY 370 WR	1163	6	2	1	2

# Components of Yield

## Definitions

- Seed per acre = (Seedcotton yield \* % seed) / seed index
- Seed index = seed size, weight of 100 seed.
- Lint index = weight of lint from 100 seed.
- Lint percentage = portion of lint in seedcotton.
- Fiber per seed = lint index / avg. weight of a fiber
- Fiber density = fibers per seed / seed size

Seed per acre most closely related to lint yield.

All other components are less affected by environment.

# Using Components of Yield

Most basic model:

$$\text{Yield} = \text{number of seed per acre} * \text{lint index}$$

Advantages of “lint index” over “number of seed per acre”:

- Gravimetric: ~1.6 lb of seed to produce 1 lb of lint.
- Energetic: 2.25x as much energy to produce oil (seed) than cellulose (fiber).

Increased reliance on “lint index” should enhance yield and yield stability.

Therefore, among group of varieties with highest yield - choose ones with relative higher lint index.

# Older Varieties Data Set: 1-year (2009)

(Ranks out of 30)

Variety	Lint yield	Open bolls	Lint %	Lint index	Seed per acre	Fibers per seed	Fiber density
DP 174 RF	1	22	1	9	10	2	3
PHY 370 WR	4	9	8	10	9	14	15

# Fiber Quality Traits

## Q-Score

Q-score – a fiber quality index of up to six HVI fiber quality parameters. Ranges from 0 to 100.

Current weights used:

Fiber length = 50

Micronaire = 25

Length uniformity = 15

Strength = 10

Research now underway to determine optimum weightings in relation to yarn quality

# Fiber quality – less trash

Less leaf pubescence on smooth-leaf & semi-smooth varieties

Density of marginal bract trichomes varies among hairy and smooth leaf varieties.

## Older Varieties Data Set: 1-year (2009)

Variety	Lint yield, rank/30	Q-score, index	Leaf pub, rating	Bract tri. rank/30
DP 174 RF	1	80	3.4	32
PHY 370 WR	4	53	3.1	33
DG 2570	6	64	2.8	27
PHY 315 RF	16	63	3.1	33
PHY 375 WRF	9	62	3.2	31
AM 1550 B2RF	18	50	1.2	24

CG 3220 B2RF	24	59	1.5	27

Tarnished plant bug, *Lygus lineolaris* (Palisot de Beauvois)

Nectaried and nectariless leaves

Damaged plants

Damaged "dirty" flower

# Use of Statistics

Lint yield across locations,  
Ark. Cotton Variety Test, 2009

Significance level	LSD
0.001	120
0.01	94
0.05	71
0.10	60
0.20	46
0.40	31
0.50	24

Two types of errors:

1. Rejecting a true  $H_0$  -Say that two means differ when they are actually equal.
2. Accepting a false  $H_0$  -Say that two means are equal when they actually differ.

Two types of mistakes:

1. Too slack – ignore LSD & statistics
2. Too strict – ignore trends.

# Cotton Variety Test Results

- State Variety Tests:
  - <http://www.cottoninc.com/AgriculturalResearch/StateVarietyTrialData/>
- COTVAR:
  - On-line: <http://cotvar.uaex.edu/intro.asp>
  - Summarizes data from all State Cotton Variety Tests
    - 3 zones (Eastern, Central, Western)
    - ~30 test locations in each zone per year
- Other variety test summary programs from companies.
  - Across company comparisons w/in company tests?
  - Accuracy of state variety test data sets?

COTVAR  
Cotton Variety Selection  
Updated 2/1/2010

COTVAR is computer program that may be used to summarize cotton variety performance data from state cotton variety tests conducted in three zones: Eastern Zone (AL, FL, GA, NC, SC, VA); Central Zone (AR, LA, MS, MO, TN); and Western Zone (AZ, CA, NM, OK, TX). (We are working on western zone data now. Several states have not yet posted 2009 data. Some of these sites may have not been harvested until Dec or Jan - so 2009 data will be late. Sitecode info still needs more work. We hope to have western zone ready to upload in a week or so, even if data are not complete.) Using COTVAR, varieties can only be directly compared over sites within one zone at a time. Within each state variety test, entries may be evaluated at different sites and in different experiments (referred to as "tests" in some state variety tests). The different experiments may be based upon maturity of varieties (early or mid-maturity) or upon years that the entry has been evaluated (main or new entry). Specific varieties entered in an experiment will typically differ among zones, among years and experiments (within a state), and among states (within a year); and may differ among sites within a year and state. Comparisons of data for different varieties are only valid when the specific varieties are evaluated in the same experiment. Development and maintenance of COTVAR is made possible by funding from **Cotton Incorporated**. Links to cotton variety test data for each state may be accessed [here](#).

## Agricultural Research

### State Variety Trial Data

These web links provide access to the 17 states that conduct cotton variety trials across the US Cotton Belt. Performance data includes lint yield, fiber quality traits, and other important agronomic traits.

**COTVAR: Variety Comparison Tool** is web-based program that may be used to summarize cotton variety performance data from state cotton variety tests conducted in five Mid-South states. Development plans are in progress to add states in the future.
