

COTMAN Research

Directed Sampling to Improve Management Efficiency

Tina Gray Teague

Arkansas State University

University of Arkansas Division of Agriculture

Quick-View Guide for When to Quit Cotton Insect Control *from* University of Arkansas Cooperative Extension MP 144.

1) Determine date of cutout using the earlier of date of NAWF=5 or Weather-restricted date (North AR: 8 Aug, Central AR: 14 Aug, South AR: 21 Aug)

2) Record daily heat units (DD60s) from Date of Cutout. (DD60s are calculated by subtracting 60 from the average daily temperature.)

Insect Pest	When to Quit Control of NEW Infestations
Tarnished Plant Bug	Cutout+250 DD60s
Bollworms & Tobacco Budworms	Cutout+350 DD60s
Stink Bugs	Cutout+450 DD60s
Fall Armyworms	Cutout+500 DD60s

Crop termination recommendations are based on long-standing and ongoing COTMAN research conducted by University of Arkansas Division of Agriculture scientists. Date of Cutout is the flowering date of the last economically significant boll population. If a field reaches physiological cutout [average number of nodes above white flower=5 (NAWF=5)] in late July or early August in Arkansas, then heat units are accumulated from the NAWF=5 date. Otherwise, heat units are accumulated from a seasonal cutout date based on historical weather for that production region. Typically, a boll needs 850 DD60s to mature with acceptable size and quality. The weather-restricted, seasonal cutout date is the calendar date on which there is a 50% probability that the crop will have the benefit of late season temperatures sufficient to develop a mature boll. Seasonal cutout dates range across the state from August 8 in northernmost parts of Arkansas (Clay County) out to August 21 in the most southern portions of the state (Ashley County).
