Flower Power

NAWF = 5

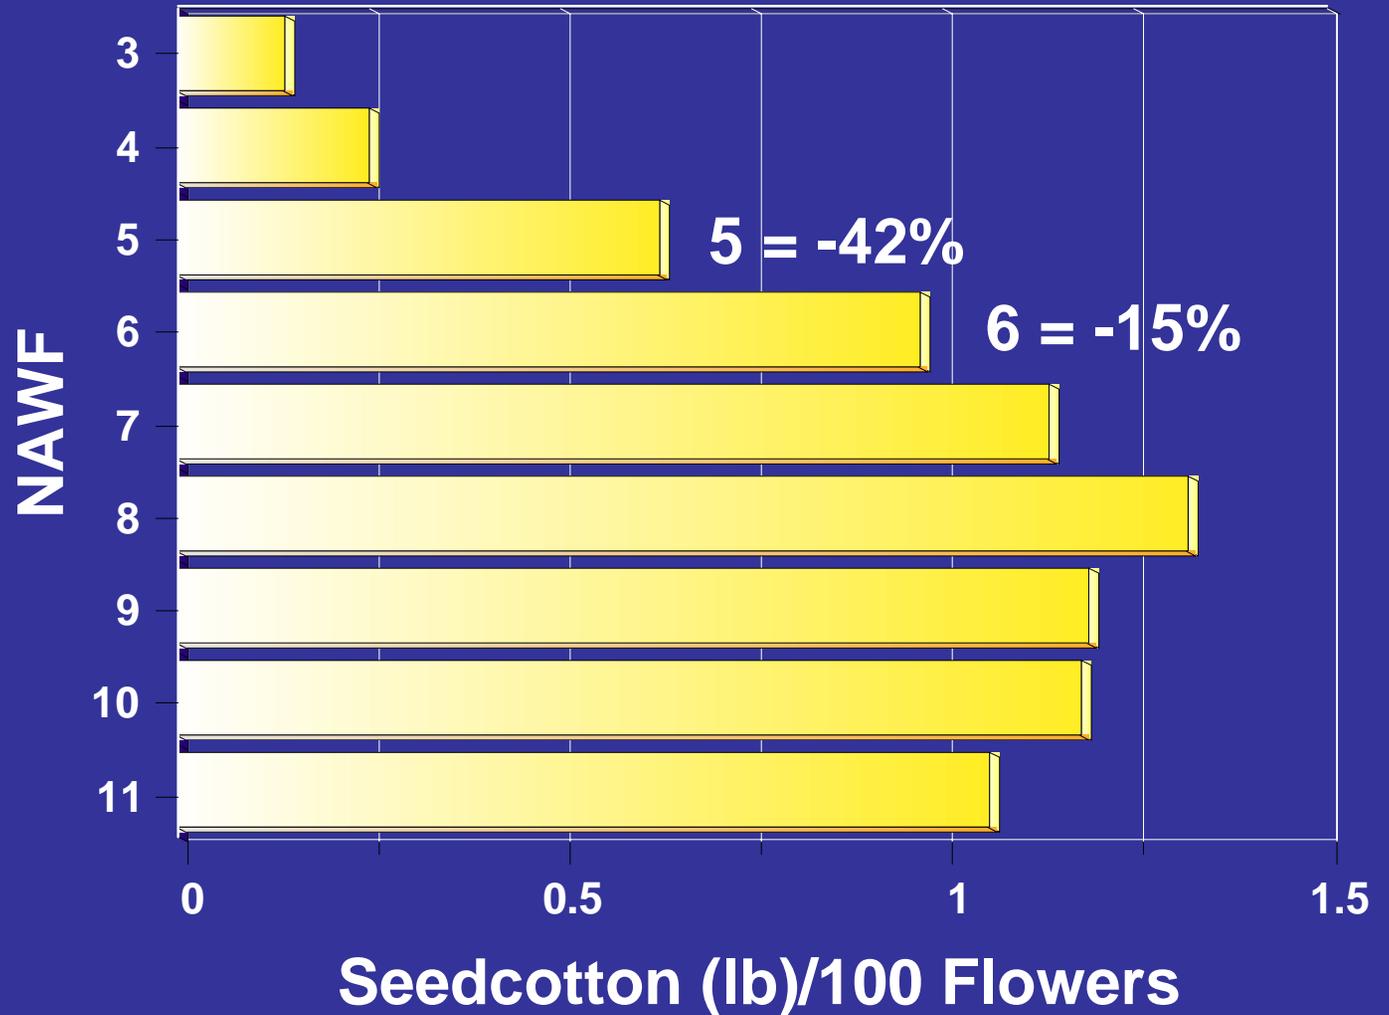

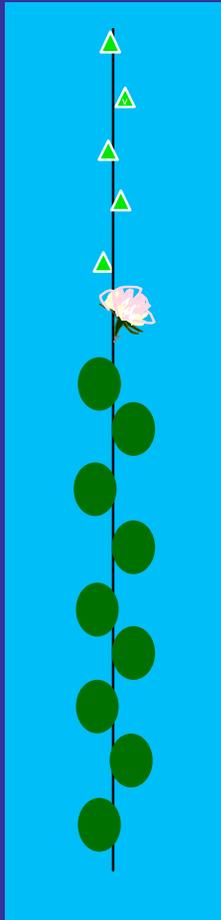

Flower Power

NAWF = 5

Early Bloom

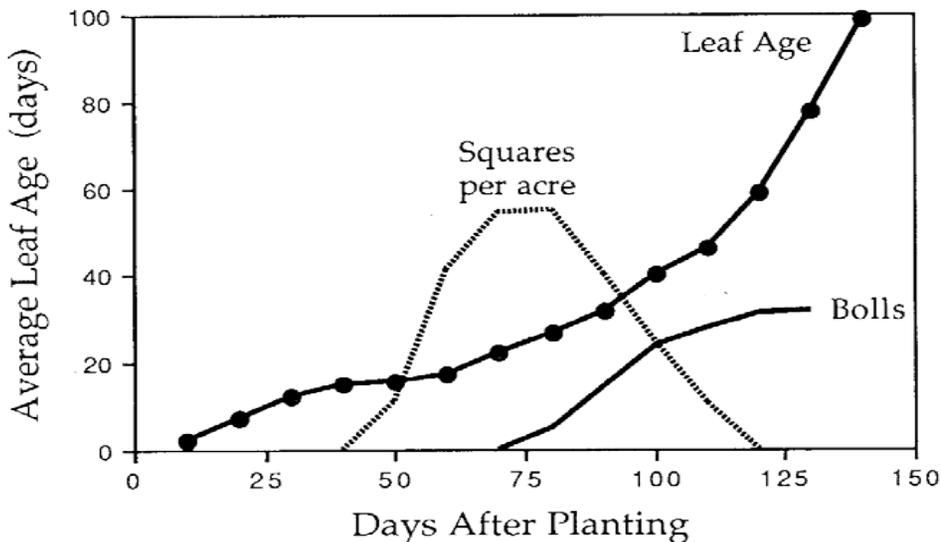

Late Bloom

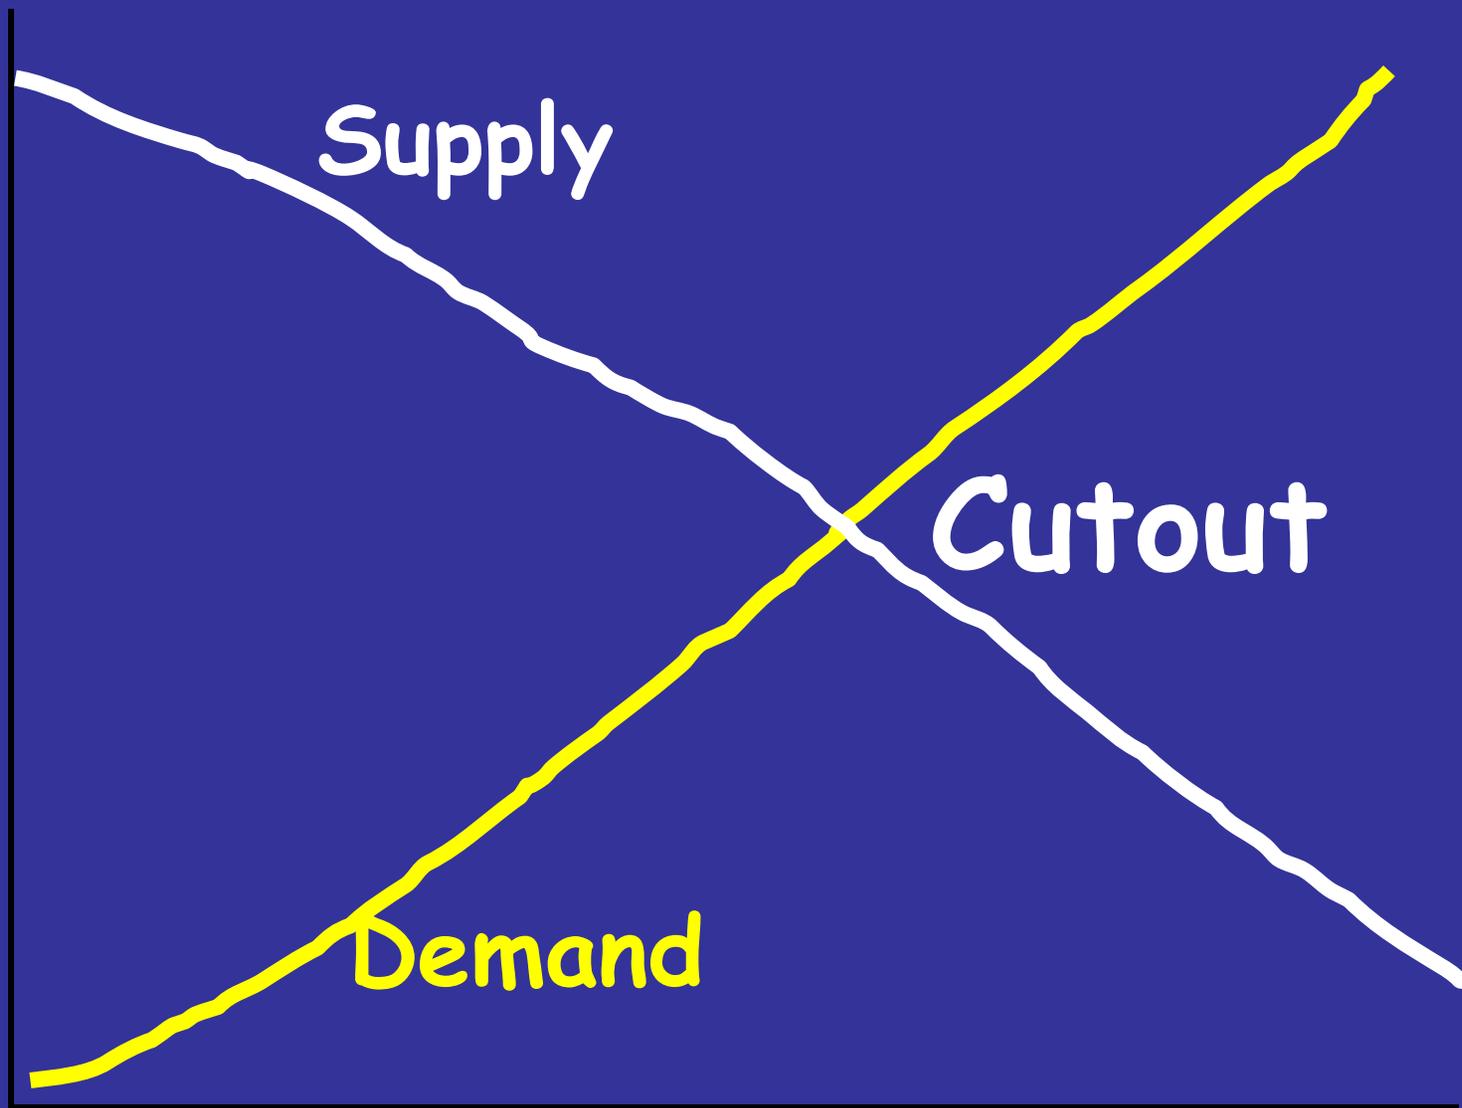

Leaf Activity With Age

Individual leaf activity drops as a leaf ages

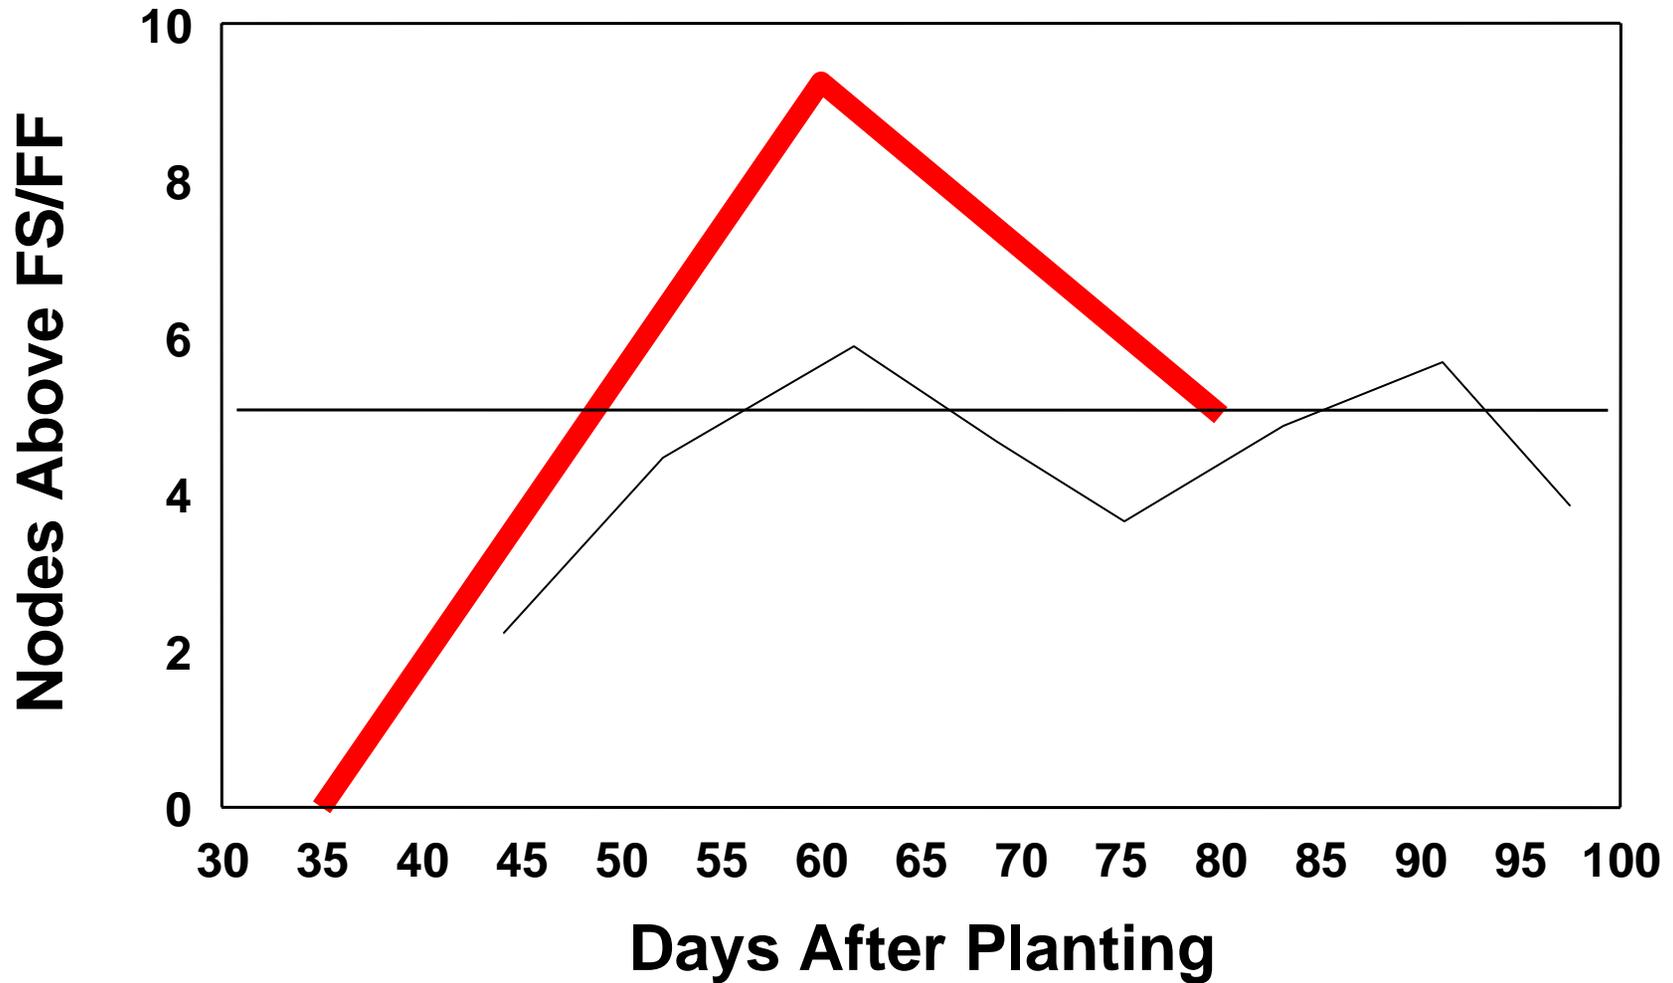

Canopy photosynthetic rates will generally decrease as the average leaf age increases

Recommendations

- Start collecting NAWF data the first week of flower.
- It is difficult to properly identify the cutout from two data points
- Cutout date can't accurately be established when NAWF values are below 5
- Consider counting total node data at cutout to assist in defoliation decisions
